

Master Thesis

# Obstacle Avoidance and Admittance Control in Human-Robot Joint Collaboration

Spring Term 2018

# Declaration of Originality

I hereby declare that the written work I have submitted entitled

**Your Project Title**

is original work which I alone have authored and which is written in my own words.<sup>1</sup>

**Author(s)**

Tobias

Ulrich

**Student supervisor(s)**

Jonathan

Kelly

**Supervising lecturer**

Marco

Hutter

With the signature I declare that I have been informed regarding normal academic citation rules and that I have read and understood the information on ‘Citation etiquette’ (<https://www.ethz.ch/content/dam/ethz/main/education/rechtliches-abschluesse/leistungskontrollen/plagiarism-citationetiquette.pdf>). The citation conventions usual to the discipline in question here have been respected.

The above written work may be tested electronically for plagiarism.

<sup>1</sup>Co-authored work: The signatures of all authors are required. Each signature attests to the originality of the entire piece of written work in its final form.

# Intellectual Property Agreement

The student acted under the supervision of Prof. Hutter and contributed to research of his group. Research results of students outside the scope of an employment contract with ETH Zurich belong to the students themselves. The results of the student within the present thesis shall be exploited by ETH Zurich, possibly together with results of other contributors in the same field. To facilitate and to enable a common exploitation of all combined research results, the student hereby assigns his rights to the research results to ETH Zurich. In exchange, the student shall be treated like an employee of ETH Zurich with respect to any income generated due to the research results.

This agreement regulates the rights to the created research results.

## 1. Intellectual Property Rights

1. The student assigns his/her rights to the research results, including inventions and works protected by copyright, but not including his moral rights (“Urheberpersönlichkeitsrechte”), to ETH Zurich. Herewith, he cedes, in particular, all rights for commercial exploitations of research results to ETH Zurich. He is doing this voluntarily and with full awareness, in order to facilitate the commercial exploitation of the created Research Results. The student’s moral rights (“Urheberpersönlichkeitsrechte”) shall not be affected by this assignment.
2. In exchange, the student will be compensated by ETH Zurich in the case of income through the commercial exploitation of research results. Compensation will be made as if the student was an employee of ETH Zurich and according to the guidelines “Richtlinien für die wirtschaftliche Verwertung von Forschungsergebnissen der ETH Zürich”.
3. The student agrees to keep all research results confidential. This obligation to confidentiality shall persist until he or she is informed by ETH Zurich that the intellectual property rights to the research results have been protected through patent applications or other adequate measures or that no protection is sought, but not longer than 12 months after the collaborator has signed this agreement.
4. If a patent application is filed for an invention based on the research results, the student will duly provide all necessary signatures. He/she also agrees to be available whenever his aid is necessary in the course of the patent application process, e.g. to respond to questions of patent examiners or the like.

## 2. Settlement of Disagreements

Should disagreements arise out between the parties, the parties will make an effort to settle them between them in good faith. In case of failure of these agreements, Swiss Law shall be applied and the Courts of Zurich shall have exclusive jurisdiction.

# Chapter 1

## Introduction

Hier kommt die Einleitung

## Chapter 2

# Related Work

As with many fields in robotics, Human Robot Interaction (HRI) has seen a lot of development in the last twenty years. Research has come from teleoperated assistive robots to dynamically and independently collaborating robots. This advancement is expressed by the newly joined terms in literature to differentiate between types of interaction and level of autonomy for the robot.

## Chapter 3

# Mobile Manipulator

We conduct our research on a mobile manipulator, lovingly called the *Thing*. It is composed of four main components, on which we elaborate in detail in this chapter. The first is the Ridgeback, an omnidirectional robot platform, followed by the UR10, a six degrees of freedom (DOF) robot arm with a three finger gripper as its end effector. A force torque sensor is embedded in the wrist of the gripper. The whole manipulator is an out of the box system assembled by Clearpath, which collaborates with Universal Robots and Robotiq and mounts the parts on the platform in house.

### 3.1 Ridgeback

Table 3.1: Clearpath Ridgeback Specifications

|                           |         |
|---------------------------|---------|
| Length                    | 960 mm  |
| Width                     | 793 mm  |
| Height                    | 296 mm  |
| Weight                    | 135 kg  |
| Maximum payload           | 100 kg  |
| Maximum velocity          | 1.1 m/s |
| Average power consumption | 800 W   |

The ridgeback is an omnidirectional robot platform designed by Clearpath for indoor movement and payload carrying tasks, such as autonomous warehousing for example. It is a fully integrated system with sensors, actuation and control and features a native ROS interface. Onboard sensors consist of an IMU and a front facing Hokuyo laser range finder (LIDAR) and a Kinect2 camera and wheel odometry. Optionally, a second, rear facing LIDAR can be mounted for full 360 ° coverage. The broad range of sensors, its flexibility and low drift in odometry makes the Ridgeback a suitable and popular platform for research in controlled indoor environments. Additionally, the Ridgeback houses the onboard computer that runs the low-level drivers of all the elements of the manipulator. On top thereof, there is a high-level driver that ensures coordination and offers a ROS interface for the user to connect to.

### 3.2 Universal Robot 10

The UR10 is an collaborative industrial robot arm by Universal Robots. It has six rotary joints which gives it six DOF and can support payloads up to 10 kg. Together

Figure 3.1: Clearpath Ridgeback

Figure 3.2: Universal Robot 10

Figure 3.3: Robotiq 3-Finger Adaptive Robot Gripper

with its little brother the UR5, it is widely regarded as the standard manipulator within robotics research. Hence, extensive platform and software integration resources are available and ROS is supported out of the box.

Table 3.2: Universal Robot 10 Specifications

|                           |                   |
|---------------------------|-------------------|
| Reach                     | 1300 mm           |
| Weight                    | 1.5 kg            |
| Repeatability             | 0.1 mm            |
| Maximum payload           | 10 kg             |
| Maximum tool velocity     | 1 m/s             |
| Degrees of freedom        | 6 rotating joints |
| Average power consumption | W                 |

### 3.3 Gripper

Table 3.3: Robotiq 3-Finger Adaptive Robot Gripper Specifications

|  |              |
|--|--------------|
| Weight                                 | 2.3 kg       |
| Repeatability                          | 0.1 mm       |
| Maximum payload (encompassing grip)    | 10 kg        |
| Gripper opening                        | 0 to 155 mm  |
| Object diameter for encompassing       | 20 to 155 mm |
| Grip force                             | 30 to 70 N   |
| Minimum power consumption              | 4.1 W        |
| Peak power (at maximum gripping force) | 36 W         |

### 3.4 Force-Torque Sensor

<sup>1</sup>Signal noise is the standard deviation of the signal measured over a period of one second.

Figure 3.4: Robotiq FT 300 Force Torque Sensor

Table 3.4: Robotiq FT 300 Force Torque Sensor Specifications

| <b>Measuring range</b>          |                   |
|---------------------------------|-------------------|
| Force $F_x, F_y, F_z$           | $\pm 300$ N       |
| Moment $M_x, M_y, M_z$          | $\pm 30$ Nm       |
| <b>Signal noise<sup>1</sup></b> |                   |
| Force $F_x, F_y, F_z$           | 0.1 N / 1 N       |
| Moment $M_x, M_y$               | 0.05 Nm / 0.02 Nm |
| Moment $M_z$                    | 0.03 Nm / 0.01 Nm |
| Data output rate                | 100 Hz            |
| Weight                          | 300 g             |

## Chapter 4

# Thing Control Structure

## Chapter 5

# Admittance Control

## Chapter 6

# Obstacle Avoidance

### 6.1 Global Planner

### 6.2 Local Planner

We use the Dynamic Window Approach (DWA) [1] for local collision avoidance. This well-known algorithm produces command velocities for a planar robot given vehicle dynamics and obstacle measurements. The basic assumption is that the robot moves instantaneously on circular arcs with a translational velocity  $v$  and a rotational velocity  $\omega$ . Thus, the complexity is greatly simplified and calculations are performed in the 2D velocity space  $(v, \omega)$ . Within this space, we compute three sets of velocity pairs, subsequently called *windows* for every iteration of the algorithm.

The obstacle window  $V_o$  are the measurements of any obstacles, e.g. taken by a range laser sensor and transformed from cartesian to  $v, \omega$  space.

The static window  $V_s$  expresses the constraint velocities of the vehicle, i.e., absolute maximum and minimum velocity.

The dynamic window  $V_d$  are the vehicle dynamics, i.e., velocities that are physically feasible for the robot to reach within one timestep. Its size is defined by the maximal acceleration and the current velocity of the robot.

$$V_r = V_o \cap V_s \cap V_d \quad (6.1)$$

The resulting window  $V_r$  of feasible velocity pairs, that guarantee no collision with an obstacle for the next step is then defined by the intersection of these three sets ??.

A cost function is then applied to find the  $(v, \omega)$  pair, that maximizes the objective within  $V_r$ . Elements are heading, distance to goal and velocity terms.

# Einige wichtige Hinweise zum Arbeiten mit L<sup>A</sup>T<sub>E</sub>X

Nachfolgend wird die Codierung einiger oft verwendeten Elemente kurz beschrieben. Das Einbinden von Bildern ist in L<sup>A</sup>T<sub>E</sub>X nicht ganz unproblematisch und hängt auch stark vom verwendeten Compiler ab. Typisches Format für Bilder in L<sup>A</sup>T<sub>E</sub>X ist EPS<sup>1</sup> oder PDF<sup>2</sup>.

### 9.1 Gliederungen

Ein Text kann mit den Befehlen `\chapter{.}`, `\section{.}`, `\subsection{.}` und `\subsubsection{.}` gegliedert werden.

### 9.2 Referenzen und Verweise

Literaturreferenzen werden mit dem Befehl `\citep{.}` und `\citet{.}` erzeugt. Beispiele: ein Buch [2], ein Buch und ein Journal Paper [2, 3], ein Konferenz Paper mit Erwähnung des Autors: Pratt and Williamson [4].

Zur Erzeugung von Fussnoten wird der Befehl `\footnote{.}` verwendet. Auch hier ein Beispiel<sup>3</sup>.

Querverweise im Text werden mit `\label{.}` verankert und mit `\cref{.}` erzeugt. Beispiel einer Referenz auf das zweite Kapitel: chapter 9.

### 9.3 Aufzählungen

Folgendes Beispiel einer Aufzählung ohne Numerierung,

- Punkt 1
- Punkt 2

wurde erzeugt mit:

```
\begin{itemize}
  \item Punkt 1
  \item Punkt 2
\end{itemize}
```

---

<sup>1</sup>Encapsulated Postscript

<sup>2</sup>Portable Document Format

<sup>3</sup>Bla bla.

Folgendes Beispiel einer Aufzählung mit Numerierung,

1. Punkt 1
2. Punkt 2

wurde erzeugt mit:

```
\begin{enumerate}
  \item Punkt 1
  \item Punkt 2
\end{enumerate}
```

Folgendes Beispiel einer Auflistung,

- P1** Punkt 1
- P2** Punkt 2

wurde erzeugt mit:

```
\begin{description}
  \item[P1] Punkt 1
  \item[P2] Punkt 2
\end{description}
```

## 9.4 Erstellen einer Tabelle

Ein Beispiel einer Tabelle:

Table 9.1: Daten der Fahrzyklen ECE, EUDC, NEFZ.

| Kennzahl                     | Einheit | ECE   | EUDC  | NEFZ   |
|------------------------------|---------|-------|-------|--------|
| Dauer                        | s       | 780   | 400   | 1180   |
| Distanz                      | km      | 4.052 | 6.955 | 11.007 |
| Durchschnittsgeschwindigkeit | km/h    | 18.7  | 62.6  | 33.6   |
| Leerlaufanteil               | %       | 36    | 10    | 27     |

Die Tabelle wurde erzeugt mit:

```
\begin{table}[h]
\begin{center}
\caption{Daten der Fahrzyklen ECE, EUDC, NEFZ.}\vspace{1ex}
\label{tab:tabnefz}
\begin{tabular}{ll|ccc}
\hline
Kennzahl & Einheit & ECE & EUDC & NEFZ \\ \hline
Dauer & s & 780 & 400 & 1180 \\
Distanz & km & 4.052 & 6.955 & 11.007 \\
Durchschnittsgeschwindigkeit & km/h & 18.7 & 62.6 & 33.6 \\
Leerlaufanteil & \% & 36 & 10 & 27 \\
\hline
\end{tabular}
\end{center}
\end{table}
```

Figure 9.1: Ein Bild

## 9.5 Einbinden einer Grafik

Das Einbinden von Graphiken kann wie folgt bewerkstelligt werden:

```
\begin{figure}
  \centering
  \includegraphics[width=0.75\textwidth]{images/k_surf.pdf}
  \caption{Ein Bild.}
  \label{fig:k_surf}
\end{figure}
```

oder bei zwei Bildern nebeneinander mit:

```
\begin{figure}
  \begin{minipage}[t]{0.48\textwidth}
    \includegraphics[width = \textwidth]{images/cycle_we.pdf}
  \end{minipage}
  \hfill
  \begin{minipage}[t]{0.48\textwidth}
    \includegraphics[width = \textwidth]{images/cycle_ml.pdf}
  \end{minipage}
  \caption{Zwei Bilder nebeneinander.}
  \label{pics:cycle}
\end{figure}
```

## 9.6 Mathematische Formeln

Einfache mathematische Formeln werden mit der equation-Umgebung erzeugt:

$$p_{me0f}(T_e, \omega_e) = k_1(T_e) \cdot (k_2 + k_3 S^2 \omega_e^2) \cdot \Pi_{\max} \cdot \sqrt{\frac{k_4}{B}}. \quad (9.1)$$

Der Code dazu lautet:

Figure 9.2: Zwei Bilder nebeneinander

```
\begin{equation}
p_{me0f}(T_e,\omega_e) \setminus = \setminus k_1(T_e) \setminus \cdot (k_2+k_3 S^2
\omega_e^2) \setminus \cdot \Pi_{\max} \setminus \cdot \sqrt{\frac{k_4}{B}} \setminus , .
\end{equation}
```

Mathematische Ausdrücke im Text werden mit  $\$formel\$$  erzeugt (z.B.:  $a^2+b^2=c^2$ ). Vektoren und Matrizen werden mit den Befehlen  $\backslash\text{vec}\{.\}$  und  $\backslash\text{mat}\{.\}$  erzeugt (z.B.  $\textit{v}$ ,  $\textit{M}$ ).

## 9.7 Weitere nützliche Befehle

Hervorhebungen im Text sehen so aus: *hervorgehoben*. Erzeugt werden sie mit dem  $\backslash\text{epmh}\{.\}$  Befehl.

Einheiten werden mit den Befehlen  $\backslash\text{unit}[1]\{m\}$  (z.B. 1 m) und  $\backslash\text{unitfrac}[1]\{m\}\{s\}$  (z.B. 1 m/s) gesetzt.

 N.C. Pin 6

**Connector** Part number  
 Molex 430-25-0600  
 Wiring diagram for Hall sensors see p. 35

**Operating Range****Comments**

**Continuous operation**  
 In observation of above listed thermal resistance (lines 17 and 18) the maximum permissible winding temperature will be reached during continuous operation at 25°C ambient.  
 = Thermal limit.

**Short term operation**  
 The motor may be briefly overloaded (recurring).
